

EPM informs public opinion:

In relation to publications of some media related to the stability of the massif and the registration of supposed “microsisms” in the PowerHouse of the Ituango hydroelectric project, the Technical Monitoring Center (TMC), with which the main civil works and the rock massif are monitored 24 hours of the day, does not present eventualities and the indicators are within the normal parameters.

In the TMC, Expert staff analyzes 650 variables, including geotechnical, seismic, hydrological, hydraulic and climatological.
